

# How do I do a Channel Scan?

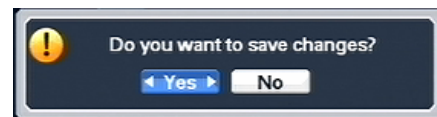

1. Switch on the Homecast PVR and make sure an antenna is connected to the ANT IN port on the PVR
2. Press the MENU button on the remote.
3. Using the ◀▶ ARROW buttons on the remote, navigate to the Installation option.
4. Using the ▲▼ ARROW buttons navigate to Auto Scan and press OK on the remote.

5. The scanning will take about 2 or 3 minutes. You can watch the green progress bar go from 0% on the left to 100% on the right. As channels are found they are added to the list on screen. Channels listed in white text are newly found channels. Channels listed in grey text already exist in the saved channel list.

6. When the channel scan is complete you should see a popup notice asking do you want to save changes.
7. Using the ◀▶ ARROW buttons on the remote, navigate to Yes and press OK
8. There are two other options in the Installation options, explained in the table below.

Option	Description	Normal Setting
Antenna	Some antennas have amplifiers that are powered via the coax cable. Only use this option if your antenna installation requires it.	OFF
Manual Scan	Use this option to manually scan for a specific frequency.
